Best Pearls of 2008

It is always difficult to pick a “best” list, particularly when I feel that every “Pearl” I wrote about was the best. Last year, I did 12; this year was even harder, so I picked 16. **Here is one of my picks for 2008.**

The STA™ System from Milestone Scientific.

This system uses Dynamic Pressure Sensing (DPS) technology to produce a predictable onset of profound single-tooth anesthesia using a virtually painless technique to any tooth for any procedure. I tried the STA System and my patients absolutely love it. This is a no brainer — go get one ASAP! Contact Milestone at www.STAis4u.com for more information.

It's this small...

Yet you can build your entire practice on it!

The dynamic of each injection experience improves "noticeably" as patients express their appreciation of the sleek, non-threatening STA handpiece. The STA System reduces patient stress and anxiety setting the tone for maximum patient comfort for every dental procedure.

Research has proven that if your patient experiences an uncomfortable injection followed by a flawless procedure – that they will remember the injection.

THE NEW STA INTRALIGAMENTARY INJECTION

You were trained to administer PDL injections with a traditional syringe or high-pressure syringe. Typically performed not knowing if you were in the right spot or not. These high-pressures can cause pain and tissue damage in the dense PDL area.

With the STA System the computer will confirm proper needle placement into the PDL space and it uses low-pressure allowing a greater volume to be administered - thus a more predictable result, longer acting and more profound anesthesia.

The STA™ System
For your patients. For your practice. For you.
